

SOS

A heritable connective tissue disorder.

I am suffering from the periodontal Ehlers-Danlos Syndrome (pEDS)

Main symptoms:

- Severe and intractable periodontitis of early onset
- Lack of attached gingiva, pretibial plaques
- Hypermobility of distal joints

Caution:

- Please treat and move me with extra care. I have an increased risk of (sub)luxations and bleeding.
- Local anesthesia may be less effective or ineffective.
- Be aware of jaw dislocations and a fragile cervical spine when intubating.
- Wound healing is delayed, be cautious of invasive procedures.
